

Onboarding and Store Setup

The first 5 minutes after signup: create shop, choose country, connect channels, add first product.

Why this exists

If onboarding feels hard, sellers quit before seeing value. This flow must get them to a working demo fast.

Primary user	New shop owner.
Business value	Higher activation. More shops reach paid trial because AI can demo with real products.
Build priority	P0 - first user journey.

1. Page Goal

- Create account and store without technical language.
- Reserve subdomain and choose business category.
- Connect Facebook/Instagram or skip for website-only start.
- Add/import first products so AI has something real to answer from.

2. How It Should Look

Step progress: Account -> Shop -> Products -> Channels -> AI mode -> Launch.
Right side preview: mobile store preview updates as seller types.
Bottom action: Back, Save draft, Continue. Never lose input.
Completion page: live URL, test AI inbox, add more products.

3. Main Sections

Account	Phone/email, password/OTP, owner name, preferred language.
Shop basics	Shop name, subdomain, logo, category, country, currency.
Products	Manual add, Excel import, Facebook catalog import later.
Channels	Connect Meta pages, Instagram, WhatsApp, courier.
Launch	Show live website and run sample AI reply.

4. User Actions

Check subdomain	Validates availability and format.	If unavailable, suggest short names.
Upload logo	Adds brand image to website and invoices.	If missing, create text logo.
Import Excel	Reads product rows and maps columns.	Show mapping screen if columns unclear.

Connect Meta	Requests page messaging permissions.	Offer skip and retry from settings.
Launch store	Publishes site and activates demo AI mode.	Block only if no product and no template.

5. Data Fields

- Owner: name, email, phone, password/OTP, language.
- Shop: legal name, display name, subdomain, category, address, country, currency.
- Policy defaults: delivery charge, return days, COD allowed, advance payment rules.
- First product: name, price, stock, image, variants, delivery notes.

6. AI / Automation Behavior

- AI suggests shop description from category and product names.
- AI writes first welcome message and FAQ answers.
- AI can clean imported product names but must ask before changing prices.
- AI test chat lets owner ask 'price?' and see how buyer reply will look.

7. Empty, Error, and Safety States

- Empty state must show one clear next button, not a blank table.
- Every destructive action needs confirm: delete, cancel order, disconnect account, refund mark.
- If third-party API fails, keep local draft and show retry.
- AI must never invent price, stock, delivery charge, delivery date, or policy.

8. Acceptance Checklist

- Signup to live store under 5 minutes for manual path.
- Seller can skip Meta connection and still launch website.
- Import errors show row number and fix instruction.
- No hidden required fields after final launch click.

9. Do Not Build Yet

- No multi-warehouse setup in onboarding.
- No complex tax setup for V1.
- No theme editor during onboarding; choose template only.
