

Orders Management Dashboard

The operations center for every order from chat, website, staff, and manual entry.

Why this exists

Sellers need one truth for order status, buyer details, courier, payment, and chat link.

Primary user	Owner, order confirmer, packer.
Business value	Reduces missed orders and staff mistakes. Critical for retention.
Build priority	P0 - daily operations.

1. Page Goal

- Show all orders with status and next action.
- Connect each order to source chat and courier tracking.
- Support bulk confirm, print, book courier, cancel, export.
- Make mobile order cards usable for small teams.

2. How It Should Look

Top metrics: new, pending confirm, packed, shipped, delivered, returned.
Filter bar: date, source, status, courier, staff, risk, payment.
Table/card: order ID, buyer, item, total, status, courier, actions.
Order detail drawer: timeline, chat, customer, items, payment, courier.

3. Main Sections

Order list	Central table/card for all orders.
Order detail	Full order record and timeline.
Bulk actions	Print invoice, book courier, export, assign.
Status pipeline	New -> Confirmed -> Packed -> Shipped -> Delivered/Returned.
Issue queue	Failed delivery, missing payment, duplicate, high risk.

4. User Actions

Open order	Shows detail drawer.	Keep user in same list position after close.
Change status	Moves order through pipeline.	Restrict backward moves with reason.
Print invoice	Generates invoice/packing slip.	If printer fails, allow PDF download.

Bulk book	Books selected orders with courier.	Skip invalid orders and show why.
Export	Downloads filtered orders.	Respect staff permission.

5. Data Fields

- Order: ID, source, status, timestamps, staff owner, notes.
- Buyer: name, phone, address, customer tags, chat link.
- Items: product snapshot, quantity, price, discount, total.
- Courier/payment: partner, tracking, fee, COD amount, paid status.

6. AI / Automation Behavior

- AI summarizes long chat into order note.
- AI flags suspicious duplicates and bad addresses.
- AI suggests next action: call, require advance, book courier, follow up.
- AI can answer owner questions about orders through command center.

7. Empty, Error, and Safety States

- Empty state must show one clear next button, not a blank table.
- Every destructive action needs confirm: delete, cancel order, disconnect account, refund mark.
- If third-party API fails, keep local draft and show retry.
- AI must never invent price, stock, delivery charge, delivery date, or policy.

8. Acceptance Checklist

- Order timeline must show every status change.
- Cancelled/returned orders keep history and stock logic.
- Bulk actions preview affected order count before running.
- Staff permissions prevent accidental deletion/export.

9. Do Not Build Yet

- No warehouse scanner app in V1.
- No complex accounting ledger inside orders.
- No marketplace seller payout system.
