

Delivery and Courier Integration

One-click booking, tracking, failed delivery handling, and courier performance view.

Why this exists

Courier work is where many Facebook sellers waste time and lose COD money.

Primary user	Owner, packer, support staff.
Business value	Sticky feature. Once courier flow works, shops do not want to leave.
Build priority	P0/P1 depending on available courier APIs.

1. Page Goal

- Connect courier partners per country.
- Book delivery from confirmed orders without retyping.
- Track parcel status and sync updates to buyer/order.
- Handle failed delivery, reschedule, return, and COD reconciliation.

2. How It Should Look

Courier settings: connected partners, pickup address, service type, default fees.
Booking queue: ready orders, validation issues, one-click book.
Tracking board: in transit, out for delivery, failed, delivered, returned.
Courier analytics: delivery rate, average time, RTO rate, COD pending.

3. Main Sections

Partner setup	Credentials, pickup, service area.
Booking	Create waybill from order.
Tracking sync	Pull status or receive webhook.
Failed delivery	Call/reschedule workflow.
Performance	Compare courier success and cost.

4. User Actions

Connect courier	Saves credentials and tests API.	If API fails, mark disconnected.
Book order	Creates shipment and tracking ID.	If invalid address, return order to issue queue.

Print label	Downloads waybill/label.	Fallback to invoice if courier label unavailable.
Reschedule	Requests new delivery attempt.	If courier disallows, create support task.
Mark delivered	Updates local status.	Prefer courier webhook over manual mark.

5. Data Fields

- Courier account: provider, credentials, pickup address, service type.
- Shipment: order ID, tracking ID, fee, COD amount, pickup date, status.
- Tracking event: status, timestamp, location, reason.
- Failed delivery: reason, buyer contact result, reschedule date.

6. AI / Automation Behavior

- AI detects bad address before booking.
- AI drafts buyer update messages based on tracking.
- AI flags courier partners with high failed delivery rates.
- AI suggests advance payment for risky areas/orders.

7. Empty, Error, and Safety States

- Empty state must show one clear next button, not a blank table.
- Every destructive action needs confirm: delete, cancel order, disconnect account, refund mark.
- If third-party API fails, keep local draft and show retry.
- AI must never invent price, stock, delivery charge, delivery date, or policy.

8. Acceptance Checklist

- No shipment without complete buyer address and phone.
- API downtime keeps retryable local booking draft.
- Manual courier mode exists for partners without API.
- Tracking status conflicts show source and last sync time.

9. Do Not Build Yet

- No own courier app.
- No rider assignment in V1.
- No international shipping unless seller base needs it.
