

Payments, COD, and Reconciliation

Tracks COD, advance payments, paid/unpaid orders, and courier cash settlement.

Why this exists

Sellers care about cash. If money records are confusing, they churn.

Primary user	Owner, accountant, support staff.
Business value	Keeps trust. Enables advance-payment risk control and financial clarity.
Build priority	P1 - after core order/courier flow.

1. Page Goal

- Support COD, partial advance, full online payment mark, manual proof.
- Reconcile delivered COD with courier settlements.
- Show unpaid, overpaid, refunded, and disputed orders.
- Keep payment actions permission-protected.

2. How It Should Look

Payment dashboard: collected, pending COD, advance received, courier due, refunds.
 Order payment panel: method, amount, proof, transaction ID, status history.
 COD reconcile table: courier statement vs system orders.
 Advance request screen: payment link/instructions sent to buyer.

3. Main Sections

Payment methods	COD, bKash/Nagad/manual, Easypaisa/JazzCash/manual.
Advance rules	Require advance by risk, area, amount, or product.
COD ledger	Expected vs received cash.
Proof review	Staff verifies screenshot/transaction ID.
Settlement	Courier payout matching.

4. User Actions

Request advance	Sends buyer payment instructions/link.	Order stays pending until paid/approved.
Mark paid	Updates paid amount and status.	Needs permission and audit reason.
Upload proof	Attaches screenshot to payment record.	If unreadable, request resend.

Reconcile COD	Matches courier settlement to delivered orders.	Unmatched rows go to issue list.
Refund mark	Records refund action.	Does not move real money unless gateway integrated.

5. Data Fields

- Payment: method, expected amount, paid amount, status, transaction ID, proof file.
- COD: courier, tracking ID, collected amount, settlement date, fee deducted.
- Advance rule: trigger, amount, message template, expiry.
- Refund/dispute: reason, amount, staff, timestamp.

6. AI / Automation Behavior

- AI recommends advance for risky orders using configured rules.
- AI reads payment proof only as assistant; staff confirms final paid status.
- AI explains mismatch: delivered but no COD, paid but order cancelled, duplicate proof.
- AI can draft buyer reminder for unpaid advance.

7. Empty, Error, and Safety States

- Empty state must show one clear next button, not a blank table.
- Every destructive action needs confirm: delete, cancel order, disconnect account, refund mark.
- If third-party API fails, keep local draft and show retry.
- AI must never invent price, stock, delivery charge, delivery date, or policy.

8. Acceptance Checklist

- Money-changing status requires permission.
- Every payment edit writes audit trail.
- Manual gateway mode must clearly say 'marked paid', not 'bank-confirmed'.
- Refund notes must not delete original payment history.

9. Do Not Build Yet

- No custom payment gateway in V1.
- No automated bank settlement unless provider API exists.
- No full accounting software replacement.
